

Career Pilot AI - QA Report

Final Sprint Smoke Test - CSC325 Capstone Project

Prepared by: Ana Garcia - Testing / UI Support / Documentation

Course: CSC325 Capstone Project - Team 01

Repository: github.com/jillsuarez/career-pilot-ai

1. Testing Environment

- OS: Windows, ran everything through PowerShell
- Did a clean clone of the repo and followed SETUP.md from scratch
- Used the local Firestore Emulator, not real Firebase - no service-account key needed for this
- Didn't have a working Gemini API key during testing - the free tokens ran out
- Tested the whole flow twice: once before the backend fix went in, then again after, to make sure it actually worked

2. Smoke Test Summary

This covers the main flow I was responsible for testing: Login → Resume Profile (save/load) → Generate → Save Document → Saved Documents.

Step	Expected Result	Actual Result	Status
Login	User can sign in with demo credentials	Signed in successfully with demo email/password	Pass
Resume Profile - Save	Profile data saves to Firestore	Initially failed with a Firestore connection error (see Bug 1). After the backend fix, save succeeded	Pass (after fix)
Resume Profile - Load	Saved profile reloads correctly	Profile reloaded correctly	Pass
Generate Resume / Cover Letter	AI generates a tailored draft	Blocked - app correctly displayed "Gemini API key is missing" error	Blocked / Not tested
Save Generated Document	Generated draft saves to Saved Documents	Not reachable - no draft was generated to save	Blocked / Not tested
Saved Documents - View	Saved documents list displays correctly	Empty state displayed correctly ("Loaded 0 saved documents.")	Pass (empty state only)

3. Bugs Found

Bug 1 - Resume Profile save fails with Firestore connection error

Severity: Critical

Status: Fixed, I confirmed it with a retest

How I found it:

- Did a clean clone and followed SETUP.md's emulator instructions
- Got the Firestore Emulator running, checked the Emulator UI (localhost:4000) and it showed Firestore as "On" on port 8081, so that part was fine
- Started the backend with FIREBASE_PROJECT_ID, USE_FIREBASE_EMULATOR=true, and FIRESTORE_EMULATOR_HOST=localhost:8081 set - it started up clean, no errors
- Logged in with the demo login
- Went to Resume Profile, filled everything in, hit Save Profile

What happened: I got this error at the bottom of the app, "Firestore request failed: io.grpc.StatusRuntimeException: INTERNAL: http2 exception". The backend terminal didn't show any error at the same time, so it seemed like it was failing somewhere between the backend and Firestore, not before that. I also tried setting the env vars manually just to rule that out, but got the same error every time.

What fixed it: The backend team pushed a fix to FirebaseConfig.java (Firestore-bugfix branch, merged into main). I pulled the update, restarted everything, and tried saving again - this time it worked and showed "Profile saved."

How I double checked it: Besides the app saying it saved, I also went into the Firestore Emulator UI directly and confirmed the data was actually there under users/demo-user/resumeProfiles/current, with all the fields I entered showing up correctly (fullName, email, phone, education, skills, experience).

Verification: In addition to the app's success message, the saved data was confirmed directly in the Firestore Emulator UI at the expected path (users/demo-user/resumeProfiles/current), with all submitted fields present and correct (fullName, email, phone, education, skills, experience).

Bug 2 - Maven flag fails on Windows PowerShell

Severity: Medium

Status: Still broken - checked again right before submitting this report

How I found it:

- Tried running `.\scripts\run-backend.ps1` and `.\scripts\run-frontend.ps1` on Windows
- Also tried the manual command `SETUP.md` tells you to run, which has `-Dmaven.repo.local=.m2\repository` in it

What happened: Maven fails right away with: `ERROR Unknown lifecycle phase ".repo.local=.m2\repository"`. Happened with both scripts and the manual command, so it's not just a script issue - it's that specific flag.

Workaround: If you just leave out the `-Dmaven.repo.local` flag, Maven runs fine off the global `.m2` repo instead. I tested this on both the backend and frontend and it worked both times.

Note: I pulled the latest changes and tried it again right before writing this up, and it's still broken, the scripts folder hasn't been touched, so this one's still open.

Bug 3 - Placeholder field labels on Generate Documents screen

Severity: Low

Status: Still open

What I found: On the Generate page, the three input boxes under "Job Brief Studio" just show "..." instead of actual labels. I'm guessing they're supposed to say something like Company, Job Title, and Job Description, but right now there's no way to tell just by looking at the form.

4. Untested / Blocked Items

I couldn't fully test resume generation, cover letter generation, or saving a generated document because I didn't have a working Gemini API key, the free tokens got used up.

The app handled it the right way, when I tried to generate something, it gave a clear error: "Gemini API key is missing. Set GEMINI_API_KEY before starting the backend." That matches what `SETUP.md` says should happen,

so at least I know the error handling for this case works. I just wasn't able to see actual AI generation or confirm that a generated doc saves correctly.

5. What's Working Well

- The light/dark theme toggle works great - switched between the two a few times and everything stayed readable and styled correctly, no layout issues.
- Error handling on the Generate page is solid - the missing Gemini key error was clear and easy to understand instead of just showing a raw error.
- The empty state on Saved Documents was handled well too - clean message, no errors, even with nothing saved yet.

6. Documentation Notes

- README.md still lists Login/Register as a "later phase," but there's already a working login screen in the app. Might want to update that so it's not misleading.
- SETUP.md's manual commands have the same broken `-Dmaven.repo.local` flag as the scripts, worth fixing or at least adding a note about the workaround.

7. Overall Assessment

Overall, the main flow, logging in, saving and loading the resume profile, and viewing saved documents, works the way it's supposed to once the Firestore fix went in, and I confirmed that myself both through the app and by checking the data directly in Firestore. I wasn't able to fully test resume/cover letter generation since I didn't have a Gemini key that worked, so that part is more of an environment limitation than something wrong with the app. One open bug left, the Maven flag issue on Windows, plus one low-priority UI labeling issue on the Generate page.
